

ABSTRACT OF THE DISCLOSURE

A recording/reproducing apparatus which can set up another timer reservation program while a timer reservation recording is continuously kept performing. When an "additional reservation" key is operated in the course of a timer reservation recording execution, an additional reservation screen is displayed. On the basis of an end time of a program currently in the course of recording execution, a recording start time of an additional reservation is input by calculating as to the time when a recording start time of a desired program starts after the recording end time. A recording time, a channel number or the like are also input together. When the "additional reservation" key is again operated, a new timer reservation program is set up. Even in the midst of such setting up, a timer recording is being performed.
